Séminaire Flajolet, June 2013

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix
TWO PROBL	EMS LINKED				

Two quite different problems

- from geometric group theory amenability of groups
- from lattice statistical mechanics ring polymers and random knotting

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix
TWO PROBL	EMS LINKED				

Two quite different problems

- from geometric group theory amenability of groups
- from lattice statistical mechanics ring polymers and random knotting

Start with simplest version of both

# Random walk on $\mathbb{Z}^2$

Start at (0, 0) and take steps N, S, E, W.

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix
ACTUALLY	— 1D IS EVEN	SIMPLER			

Start at 0 and take steps E, W

• What is probability of ending at 0?

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix
ACTUALLY	— 1D IS EVEN	SIMPLER			

Start at 0 and take steps E, W

- What is probability of ending at 0?
- How many paths of length 2n end at  $0 c_{2n,0}$

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix
ACTUALLY	— 1D IS EVEN	SIMPLER			

Start at 0 and take steps E, W

- What is probability of ending at 0?
- How many paths of length 2n end at  $0 c_{2n,0}$

$$c_{2n,0} = \binom{2n}{n} = 1, 2, 6, 20, 70 \dots$$

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix
ACTUALL	y = 1 dis fy	/FN SIMPLER			

Start at 0 and take steps E, W

- What is probability of ending at 0?
- How many paths of length 2n end at  $0 c_{2n,0}$

$$c_{2n,0} = \binom{2n}{n} = 1, 2, 6, 20, 70 \dots$$

Returning to 0 — only even lengths  $Pr(end at 0) = \frac{\binom{2n}{n}}{2^{2n}} \sim \frac{1}{\sqrt{\pi n}}$  polynomial decay

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix
BACK TO 2D	)				

• What is probability of ending at (0,0)? —  $c_{n,(0,0)} =$ ?

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix
BACK TO 2D	)				

• What is probability of ending at (0,0)? —  $c_{n,(0,0)} =$ ?

$$\sum_{n} c_{n,(0,0)} \cdot z^{n} = 1 + 4z^{2} + 36z^{4} + 400z^{6} + 4900z^{8} + \dots$$

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix
BACK TO 2D	)				

• What is probability of ending at (0,0)? —  $c_{n,(0,0)} =$ ?

$$\sum_{n} c_{n,(0,0)} \cdot z^{n} = 1 + 4z^{2} + 36z^{4} + 400z^{6} + 4900z^{8} + \dots$$

• Why are the terms  $\binom{2n}{n}^2$ ?

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix
ROTATE	EVERYTHING				

Each step

- changes the *x*-ordinate by  $\pm 1$ , and
- changes the *y*-ordinate by  $\pm 1$

So split into two independent 1d problems — each gives  $\binom{2n}{n}$ .

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix
Rotati	E EVERYTHING				

Each step

- changes the *x*-ordinate by  $\pm 1$ , and
- changes the *y*-ordinate by  $\pm 1$

So split into two independent 1d problems — each gives  $\binom{2n}{n}$ .

Rechnitzer

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix

## DO THE SAME THING ON A TREE

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix

#### DO THE SAME THING ON A TREE

$$\sum_{n} t_{n,0} z^{n} = \frac{3}{1 + 2\sqrt{1 - 12z^{2}}}$$

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix

#### DO THE SAME THING ON A TREE

$$\sum_{n} t_{n,0} z^n = \frac{3}{1 + 2\sqrt{1 - 12z^2}}$$

Return to root vertex — even lengths only

$$\Pr(\text{end at root}) \sim 6\sqrt{\frac{2}{\pi n^3}} \cdot \left(\frac{\sqrt{3}}{2}\right)^n$$
 exponential decay

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix
$\mathbb{Z}^2$ and $F_2$ A	RE EASY CASE	E OF HARD PRO	BLEM		

These random walks are special cases of bigger problem

Walks on Cayley graph of group
Let G = ⟨a, b | relations ⟩
what is the probability that a random word ≡ identity?

These random walks are special cases of bigger problem

 Walks on Cayley graph of group

 Let  $G = \langle a, b \mid \text{ relations } \rangle$  

 • what is the probability that a random word  $\equiv$  identity?

 Amenability
 [Kesten, Grigorchuk, Cohen]

 Let  $p_n$  be the number of words of length n in G equivalent to the identity.

 G is amenable  $\Leftrightarrow \limsup_{n \to \infty} p_n^{1/n} = 4$ 

These random walks are special cases of bigger problem

 Walks on Cayley graph of group

 Let  $G = \langle a, b \mid \text{ relations } \rangle$  

 • what is the probability that a random word  $\equiv$  identity?

 Amenability
 [Kesten, Grigorchuk, Cohen]

 Let  $p_n$  be the number of words of length n in G equivalent to the identity.

 G is amenable  $\Leftrightarrow \limsup_{n \to \infty} p_n^{1/n} = 4$ 

A very open problem for Thompson's group *F*.

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix
PIECEWISE	LINEAR I	FUNCTIONS			

Consider continuous piecewise linear functions from  $[0,1] \mapsto [0,1]$  such that

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix
PIECEWISE	LINEAR I	FUNCTIONS			

Consider continuous piecewise linear functions from  $[0,1] \mapsto [0,1]$  such that

- f(0) = 0 and f(1) = 1
- all gradients are powers of 2
- coordinates of breakpoints are dyadic rationals <sup>a</sup>/<sub>2<sup>b</sup></sub>.

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix
PIECEWISE	E LINEAR F	UNCTIONS			

Consider continuous piecewise linear functions from  $[0, 1] \mapsto [0, 1]$  such that

- f(0) = 0 and f(1) = 1
- all gradients are powers of 2
- coordinates of breakpoints are dyadic rationals <sup>a</sup>/<sub>2<sup>b</sup></sub>.
- Function composition defines a natural group on these objects.

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix
PIECEWISE	LINEAR H	FUNCTIONS			

Consider continuous piecewise linear functions from  $[0,1] \mapsto [0,1]$  such that

- f(0) = 0 and f(1) = 1
- all gradients are powers of 2
- coordinates of breakpoints are dyadic rationals <sup>a</sup>/<sub>2<sup>b</sup></sub>.
- Function composition defines a natural group on these objects.

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix

- Looked at from the side, cosets form a tree

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix
Now do B	S(2,2)				

- It is not flat
- Parity of *x*-ordinate decides if vertical step moves to a different "sheet"
- Looked at from the side, cosets form a tree

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix
Now do E	S(2,2)				

- It is not flat
- Parity of *x*-ordinate decides if vertical step moves to a different "sheet"
- Looked at from the side, cosets form a tree
- Factor as before, but more care to decide if  $b, \overline{b}$  moves to or from root.

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix
SCHEMATIC	C FACTORIS	ATION			

 $G(z;q) = 1 + z \left(q + \bar{q}\right) G(z,q) + 2z^2 G(z;q) \left[\mathcal{E} \circ L(z;q)\right]$ 

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix
SCHEMATIC	FACTORIS	ATION			

 $\begin{aligned} G(z;q) &= 1 + z \left( q + \bar{q} \right) G(z,q) + 2z^2 G(z;q) \left[ \mathcal{E} \circ L(z;q) \right] \\ L(z;q) &= 1 + z \left( q + \bar{q} \right) L(z;q) + z^2 L(z;q) \left[ \mathcal{E} \circ L(z;q) \right] + z^2 \left[ \mathcal{O} \circ L(z;q) \right] \left[ \mathcal{E} \circ L(z;q) \right] \end{aligned}$ 

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix
Schematic	C FACTORIS	SATION			

 $\begin{aligned} G(z;q) &= 1 + z \left( q + \bar{q} \right) G(z,q) + 2z^2 G(z;q) \left[ \mathcal{E} \circ L(z;q) \right] \\ L(z;q) &= 1 + z \left( q + \bar{q} \right) L(z;q) + z^2 L(z;q) \left[ \mathcal{E} \circ L(z;q) \right] + z^2 \left[ \mathcal{O} \circ L(z;q) \right] \left[ \mathcal{E} \circ L(z;q) \right] \end{aligned}$ 

- Solve for G(z;q) algebraic function
- Take constant term wrt *q* D-finite function

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix
More ge	NERALLY				

- Similar factorisation gives G(z, q) algebraic degree N + 1
- Take constant term wrt *q* gives D-finite solution

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix
More ge	ENERALLY				

- Similar factorisation gives G(z,q) algebraic degree N + 1
- Take constant term wrt *q* gives D-finite solution
- Growth rate of trivial words are algebraic numbers
- The DE satisfied by the CT gets worse with N

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix

MORE GENE	ERALLY STILL -	— MESSIER			

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix
More generally still — messier					

Functional equations for  $BS(N, M) = \langle a, b \mid a^N b = ba^M \rangle$ 

$$\begin{split} L &= 1 + z(q + \bar{q})L + z^2L \cdot \left[\Phi_{N,M} \circ L + \Phi_{M,N} \circ K\right] - z^2 \left[\Phi_{M,N} \circ K\right] \cdot \left[\Phi_{N,N} \circ L\right], \\ K &= 1 + z(q + \bar{q})K + z^2K \cdot \left[\Phi_{M,N} \circ K + \Phi_{N,M} \circ L\right] - z^2 \left[\Phi_{N,M} \circ L\right] \cdot \left[\Phi_{M,M} \circ K\right], \\ G &= 1 + z(q + \bar{q})G + z^2G \cdot \left[\Phi_{N,M} \circ L + \Phi_{M,N} \circ K\right], \end{split}$$

where

$$\Phi_{d,e} \circ \sum_{k} c_{n,k} q^{k} = \sum_{j} c_{n,dj} q^{ej}$$

Warm-up	Thompson	Back to grid	BFACF	Results	Appendix
More generally still — messier					

Functional equations for  $BS(N, M) = \langle a, b \mid a^N b = ba^M \rangle$ 

$$\begin{split} & L = 1 + z(q + \bar{q})L + z^2L \cdot \left[\Phi_{N,M} \circ L + \Phi_{M,N} \circ K\right] - z^2 \left[\Phi_{M,N} \circ K\right] \cdot \left[\Phi_{N,N} \circ L\right], \\ & K = 1 + z(q + \bar{q})K + z^2K \cdot \left[\Phi_{M,N} \circ K + \Phi_{N,M} \circ L\right] - z^2 \left[\Phi_{N,M} \circ L\right] \cdot \left[\Phi_{M,M} \circ K\right], \\ & G = 1 + z(q + \bar{q})G + z^2G \cdot \left[\Phi_{N,M} \circ L + \Phi_{M,N} \circ K\right], \end{split}$$

where

$$\Phi_{d,e} \circ \sum_k c_{n,k} q^k = \sum_j c_{n,dj} q^{ej}$$

• Unable to solve closed form — even for *BS*(1,2).

More generally still — messier					

Functional equations for  $BS(N, M) = \langle a, b \mid a^N b = ba^M \rangle$ 

$$\begin{split} L &= 1 + z(q + \bar{q})L + z^2L \cdot \left[\Phi_{N,M} \circ L + \Phi_{M,N} \circ K\right] - z^2 \left[\Phi_{M,N} \circ K\right] \cdot \left[\Phi_{N,N} \circ L\right], \\ K &= 1 + z(q + \bar{q})K + z^2K \cdot \left[\Phi_{M,N} \circ K + \Phi_{N,M} \circ L\right] - z^2 \left[\Phi_{N,M} \circ L\right] \cdot \left[\Phi_{M,M} \circ K\right], \\ G &= 1 + z(q + \bar{q})G + z^2G \cdot \left[\Phi_{N,M} \circ L + \Phi_{M,N} \circ K\right], \end{split}$$

where

$$\Phi_{d,e} \circ \sum_k c_{n,k} q^k = \sum_j c_{n,dj} q^{ej}$$

- Unable to solve closed form even for *BS*(1,2).
- Series generation hard since  $\deg_{q}[z^{n}]G(z;q)$  grows exponentially with *n*.
